

A Declared biochemical membership

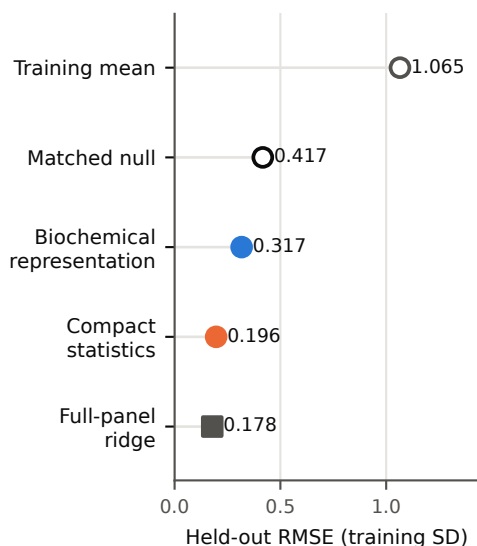

Matched null: same degrees, rewired membership

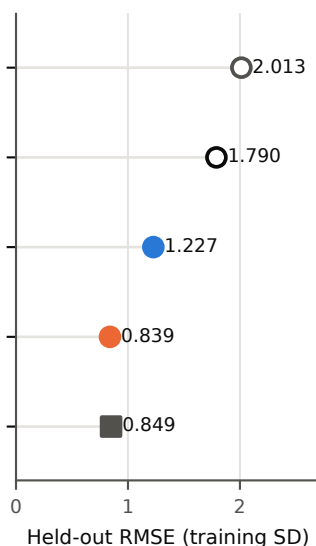

The null keeps every descriptor's size and every lipid's number of descriptors; which lipids co-occur in a descriptor, and hence pairwise overlaps, are randomized. Circles and squares mark two lipid classes.

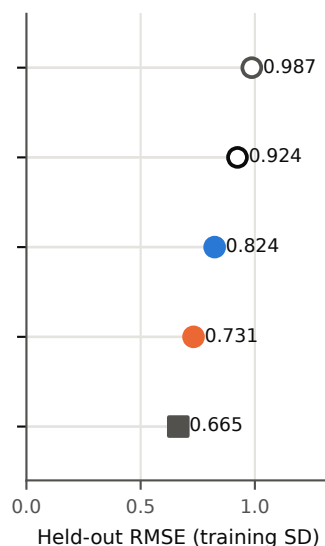

B ST002081

C ST000818

D CCLE

Lower is better. CCLE rungs: reaction neighbours (biochemical), correlation-selected panel of the same size (compact), all other metabolites (full panel). Matched nulls are expected values over 20 realizations.

E Both steps, median or fixed-neighbour aggregation
